According to PC Magazine, the first AutoCAD installation was completed in 1983 by Craig Clapp and the first AutoCAD drawing was an intricate drawing of the fasces symbol. Features AutoCAD Commercial Computer-aided Design and Drafting Desktop, Mobile and Web Apps Flexible geometric modeling and "multi-view" design 3D stereoscopic visualization Visual interfaces and task-oriented modeling Linear and angular drafting Solid modeling Part, assembly, and model-based 3D design Advanced finite element analysis Advanced surface design Fast iteration and high-performance drafting History AutoCAD was originally developed by a team led by Jim Lyles, based on a modest investment of \$5,000. The original AutoCAD operated on a DEC PDP 11 computer and was called "Graphics Clics" after its developer, Bob Clapp. It was sold for \$250,000 in 1983 and was supported by a staff of 15. In 1983, Version 1.0 of AutoCAD for the PDP 11 was released. In 1984, Version 1.1 added the ability to connect to a text-based coordinate system, and to create graphical symbols. In 1985, Version 1.2 introduced concepts such as CAD-style text, CAD graphics, full 3D display, and 2D plot generation. AutoCAD for the PDP 11 was the first successful CAGD system, used by many companies in the U.S. and abroad, including Union Carbide, the French Ministry of Defense, General Electric, the United Nations, and the largest aerospace companies. In 1988, Autodesk changed the name of the software to AutoCAD. The new name was used to reflect the new product's scope, which had now expanded from pure 2D drafting to include a full range of 2D and 3D drawing and drafting functions. In April 1989, Autodesk released AutoCAD for the Apple Macintosh in four versions: DX/40, DX/50, DX/55, and DX/60. In 1990, the product was ported to Unix platforms, and the Mac version was renamed for Windows, and the first public version of AutoCAD for the Windows platform was released. This release was called AutoCAD Version 1.5. In 1991, AutoCAD Professional Edition was released for the Windows platform.

Field of the Invention This invention relates to trusses, in general, and to method and apparatus for the manufacture of preformed trusses, in particular. 2. Description of the Prior Art Lattice trusses have long been known for supporting roofs and walls and for allowing flexibility in the design of buildings. Lattice trusses are characterized by a framework of interlocking vertical and horizontal members. Lattice trusses were often formed in factories, shipped to the building site, and installed in place, usually along with the roofing material. Such construction, involving a great deal of labor, was expensive and tedious. More recently, attempts have been made to provide trusses that are pre-formed, that is to say, which are constructed in factory and packaged for shipping to the building site and are then erected in place. The pre-formed trusses that have been available heretofore have had various disadvantages. One disadvantage of most pre-formed trusses is that they are not load-bearing. A second disadvantage is that they are characterized by a comparatively high wind load factor, thereby making them difficult to handle during installation. One example of a prior pre-formed truss is shown in U.S. Pat. No. 2,435,927, which is directed to a railroad car roofing truss which comprises a plurality of short lattice rail members and a plurality of continuous length rails connected to the rail members. Another example is U.S. Pat. No. 4,067,342, which is directed to a preformed truss assembly composed of a plurality of elongated building members of substantially equal length which are connected together by end connectors at their outermost ends. The building members are horizontally aligned with their end connectors contacting one another at the same level. U-shaped bridging members are provided for interconnecting two rows of building members. The building members and the bridging members form a plurality of parallel vertical columns which support each other. The pre-formed trusses, such as those described in U.S. Pat. No. 2,435,927 and a1d647c40b
