File Router is a small program written in Visual Basic that monitors the drive for files and moves them appropriately. Just place in the Start Menu or desktop shortcut, then it will open a standard application window for you to control the program. It's easy to set up. In the Source field type in the directory you'd like to monitor. In the Mappings area, type in a list of strings to match in filenames, then select a destination. This would be the folder where you'd like to move files. Select any existing mappings. Select a row in the ListBox and click Remove to remove it, but you can't edit it. You can add new mappings with the Add button. Type in a list of strings to watch for in filenames, select a destination, then click Add.

The Expression field should be a simple Contains pattern, for example, ".txt" or "php". File Router Features: - It works with all three versions of Windows: XP, Vista, Windows 7 and 8. - You can add or remove folders from the list of monitored folders with the Remove button. - The destination folder can be of any type, not just subfolders. For example, you can put a File Router shortcut on your desktop and it will work anywhere. - Mappings are added to the ListBox. Select a row and click Remove to remove it, but you can't edit it. - The Expressions field contains any number of Contains pattern matches. For example, you can have a File Router shortcut on your desktop and it will work anywhere. - File Router is a freeware application. - File Router uses .NET Framework 3.5. You can get it at - File Router is compatible with Windows XP SP3, Vista, Windows 7 and Windows 8. - File Router is designed to work with 64-bit Windows only. - Version History: V0.0.1 - Initial release. The File Router application was designed to be a small tool which monitors a path on the hard drive and moves files to appropriate locations based on matching certain patterns. For example, .avi and .wmv to Movies, .doc and .ppt to Documents. This project was inspired by the many times I've come across catch-all folders on people's hard drives. Maybe you've got them too. Perhaps it's a documents folder where every file goes uncategorized. I also see downloads folders that contain Zip files, PDF documents, photos, installers and anything else downloaded. Internet Explorer and Firefox download to a single folder unless overridden. Many users either don't know how to manage folders or just don't spend the time to do so. From these observations I decided it would be nice to do something to reduce this burden, and thus, File Router was born. File Router acts by monitoring a path on the hard drive, then moving files to appropriate locations based on matching certain patterns. The application is fairly basic, with plenty of opportunity for extension. That's a plus for you, not a cop-out for me! There are only a few things to know. The Source field is the directory that File Router will monitor. Check the Scan source directory recursively checkbox if there are subfolders to watch. The Mappings area needs a little more explanation. The big ListBox shows any existing mappings. To add one, type in a list of strings to watch for in filenames, select a destination, then click Add. You can select a row in the list and click Remove to get rid of it, but you can't edit it. Sorry, but it's remove and re-add at this point. That's a great enhancement if someone wants to pitch in. The only trick with the Expression field is that you can multiple patterns set up to route to the same destination. Each much be separated by a comma. These should probably be regular expressions, but are just simple Contains matches. For a file extension, just specify it with the "dot" like ".avi" so it doesn't find "avi" in the middle of a different filename. Design Project: File Router was designed as a way to move stuff around a computer based on patterns. It's designed to be simple, easy to use and hopefully not too confusing. The application gives a graphical view of a file path and allows you to see what files are there. To move something to a specific folder you simply choose the folder and File

While this is a new setting, it's still an old game. So, if you're used to something else, this will be different. When you first start the game, you'll be prompted to use a controller or play with keyboard and mouse. I highly recommend the controller because it's quite fun to shoot things and has a small learning curve. All in all, I'd say that this is probably for players on the Xbox One and PlayStation 4. - Controls: Keyboard and Mouse Xbox One Controller DirectX 10/11
