MJPEG, the abbreviation of Moving Picture Experts Group, is a well-known standard for streaming digital images. It has been adopted by most major companies for video recording. It is the only public image file format that supports both high quality and low cost. Unlike AVI files, MJPEG videos can be directly displayed on many types of consumer electronic products such as digital TVs, digital cameras, and video recorders. Features: #Compression (or Decompression) The quality of the decompression is the most important feature of a MJPEG encoder. If the quality is low, the video will be very clear, but with very low compression ratio. For high quality, the compression ratio is low. For example: You want to compress a video for your PC with a specified compression ratio, then the output quality is the same as the specified compression ratio. If you want to compress a video for a mobile phone with low compression ratio, the quality is low. The output quality and compression ratio are identical if the output video quality is specified as MJPEG EOQ FAST or INT. The following are decompression modes: -FAST- : very fast -INT- : less fast, but the decompression quality is good -SLOW- : the decompression quality is poor, but the speed is fast #Bitrate Control To control the quality of video with a given bit rate and video size, we can make bit rate control. -FORCED QUALITY If you want to control the quality of video with a bit rate or size, you can make forced quality. #Uncompress If you want to uncompress a MJPEG file, you can set the output type to IJG (I=Integer, J=Float). #Output to Video Morgan Multimedia MJPEG Codec allows you to decompress MJPEG videos and to encode the video files. After you decompress a MJPEG file, you can choose one of the available output formats: -I/O:avi -I/O:MOV -I/O:ASF -I/O:NSV -I/O:WAV #I/O:WMV #Video output to external video/audio devices You can set your video/audio devices. #I/O:AVI (for video) #I/O:MOV (
