There were several points of disagreement, which we would like to address as follows: First, the response letter from reviewer 1 stated that the paper did not provide evidence that CBT was not effective in reducing positive symptoms. Our paper, however, only evaluated the effectiveness of CBT as a monotherapy. Our reviewers were invited to analyze studies that had a combination of pharmacotherapy and CBT as treatment. Reviewers' comments: A more rigorous search should be conducted to see if there are any effective trials that included cognitive behavioural therapy as part of their treatment plan (reviewer 1, comment 1). All included studies should be reported and analyzed (reviewer 2, comment 5). Risk of bias assessment should be applied to all studies included, particularly to those that used a randomization method (reviewer 1, comment 5). Second, reviewer 1 suggested that future studies should focus on improving the quality of published trials, particularly those that lack appropriate blinding. Reviewers' comments: Most of the included trials did not employ blind assessments (comment 1). Oddly, both reviewers were critical of the reporting of statistical tests. We agree that it would be appropriate to report all statistically significant findings of all included trials (reviewers 2 and 3), however, we believe that the importance of such an approach is overstated. Because we only wanted to evaluate the effectiveness of CBT monotherapy for positive symptoms,
