Q: How to make Swing wait while the JavaFX app is loading? I've created a JavaFX app which is mostly images. However, when it runs, it loads the images inline, like this: public void start(Stage primaryStage) throws Exception { ScrollPane scrollPane = new ScrollPane(); Scene scene = new Scene(scrollPane, WIDTH, HEIGHT); primaryStage.setScene(scene); for(File picture: pictureFile) { Image image = new Image(picture.toURI().toString()); image.setStyle("-fx-alignment: center; -fx-scale-height: 2; -fx-scale-width: 2;"); image.setFitHeight(WIDTH/2); image.setFitWidth(WIDTH/2); scrollPane.setContent(image); } } As you can see, it only loads the images right after I call start. Is there any way to modify the code to make it wait until all the images are loaded? A: You could set the imagesLoaded property of the ScrollPane to false and then have your loop set it to true: for(File picture: pictureFile) { Image image = new Image(picture.toURI().toString()); image.setStyle("-fx-alignment: center; -fx-scale-height: 2; -fx-scale-width: 2;"); image.setFitHeight(WIDTH/2); image.setFitWidth(WIDTH/2); scrollPane.setContent(image); image.loadImage(); scrollPane.setImagesLoaded(true); } It will prevent the initial loading if the images are missing, so you won't need to call the loadImage() function each time. Of course, if you want to have them fade in, you will need to call the loadImage() function manually in the for loop. A:

Rational optimization of enzymatic hydrolysis of starch. Starch is an abundant bioresource, but it has high solubility in water, which limits the applications. This study was carried out to develop an efficient procedure to improve the enzymatic hydrolysis of starch. The effects of starch concentration, pH, temperature and time on hydrolysis were investigated using the amylase from Aspergillus oryzae E-15 as the catalyst, and succinic acid monomethyl ester (SAM) as the catalyst. After 8 h hydrolysis, the enzymatic hydrolysis of cornstarch with 5 mg enzyme and 1 mg SAM was 72.2%. The initial concentration of starch and pH could markedly increase the hydrolysis rate. For the samples with 72.2% hydrolysis

at 0.5 h, the optimum conditions were 1.2 mg/ml cornstarch, pH 5.2 and 72.2% hydrolysis. In a column reactor, the hydrolysis of starch using 1.2 mg enzyme and 1 mg SAM followed the pseudo-zero order kinetics, with a half-life of 3.39 h. By controlling the pH and temperature, the hydrolysis of starch by A. oryzae E-15 was carried out efficiently, providing a new method for the industrial production of oligosaccharides.[Ultrastructural changes in the muscles of hypothyroid rats. 1. A scanning electron microscopy study]. In this study the ultrastructure of the anterior tibial muscle of hypothyroid rats (hypothyroidism produced by treatment with 0.02% propylthiouracile for 30 days) was examined using the scanning electron microscope. When compared with the control group, hypothyroid rats showed muscle atrophy with degenerative changes. The number of type I and IIA fibers were significantly decreased. In addition the ratio of type IIB/IIA, type IIB/IIC/IIA, and IIA/IIC fibers were also decreased. In hypothyroidism, the number of the muscle fibers was significantly increased when compared with the control group. An increased amount of muscle fibers was observed in a few areas of the myotubes. After 5 days of being deprived of thyroxine replacement therapy, there was a significant recovery. The atrophy process was shown to be reversible in most of the fibers.1. Field of the
