It comes packed with an intuitive interface and features, accessible to all types of users, regardless of their skill level. The advantages of a portable app Since installation is not a requirement, you can drop the program files anywhere on the hard disk and click the executable to run. As an alternative, you can save Email Worker Professional to a USB flash disk or similar storage unit, in order to run it on any workstation with minimum effort. What's more, the Windows registry is not going to be updated with new entries, and leftover files are not kept on the hard disk after removing the program. Add addresses and view results in the main window Importing emails into the workspace is done by loading files with multiple addresses (TXT, CSV, XLS, DOC, XML) or by manually inputting them, one email address at a time. It is possible to import multiple documents at once. After starting the validity verification sequence, Email Worker Professional displays the email address, result and details for each item. This list is cleared with every new operation. Save results, view history and adjust the number of threads used However, Email Worker Professional records history and gives you the possibility of exporting the submitted email addresses (successful, failed, or all) to a plain text document. It also lets you select the number of emails per file (or unlimited), and automatically opens the target folder afterwards. Unfortunately, you cannot set a custom saving directory. From the Settings panel you may adjust the number of threads and time interval, reset emails by marking them as "unconfirmed", as well as delete them from the database (successful, failed, or unconfirmed). Bottom line The application is low-demanding concerning CPU and RAM, so it does not interrupt normal activity. We have not come across any issues in our evaluation, since this program did not hang, crash or show error dialogs. This program is an easy-to-use utility designed for validating the validity of Internet email addresses. This multi-threaded and multi-lingual program automatically extracts the sender, recipient, domain (mail server) and message parts from a given text file. After this, a trial check is performed in order to make sure that the email is valid and it is then stored to the database for further verification. The program also makes it possible to sort the address list, based on email body, sender, recipient, domain and other criteria. The program displays detailed information about each message, including message and email body type, sender, date and recipient. You can print out a history list to a plain text file or an Excel spreadsheet. The program supports the following file types: -.CSV (comma-separated values) -.XLS (Microsoft Excel) -.TXT -.DOC -.XML -.HTML -.CSV-MIME (comma-separated values that include MIME types) -.CSV-MIME-HTML (comma-separated values that include MIME types that also contain HTML) If the parsing of the file fails, you can choose to cancel and undo the last action taken by the program. The program uses multi-threading in order to deal with the large amount of files. This technology allows you to process a large number of files simultaneously. The program uses only small amounts of free memory and it does not make any requests for additional permissions. Like other aspects of the program, it is portable and it requires no installation. You can load emails as a whole, by using multiple file formats or manually by inputting each email address in the program. The program will tell you whether or not you can send the email. Unlike other applications, it gives detailed results, including message and email body type, sender, recipient, date, source, airdrop and other details. Please keep in mind that it works perfectly with any of the most popular Internet email clients, such as Windows Live Mail, Outlook Express, Thunderbird or Outlook.
