Evergreen State College Students Mobilize to Protest Anti-Trans Legislation With student walkouts and protests occurring across the country in solidarity with the attack on transgender students in North Carolina, a number of Evergreen State College students are also organizing a series of protests to draw attention to the college's anti-trans "Bill 17," the "Student Rights Bill." On Monday, students organized a sit-in at the Evergreen President's Office. As of this writing, it has been announced that the Evergreen student senate will not consider the bill. (This is a developing story. For more information, check out our the Evergreen State College coverage.) In a Facebook post, Evergreen State College student and anti-Bill 17 activist Hania Aguilar-Mosley wrote that "Students are gathering in support of the students of Evergreen State College [who] are in danger because of their unwillingness to accept the ideas of the right wing Christians who believe that all people are not equal." In a statement released by Evergreen, the college explained that it "has student senators, and they consider all student concerns when they are legislating the college." The statement further explained that Evergreen students are "protesting anti-transgender bill 17," adding that "this bill, which will be considered by the student senate next week, is contrary to our campus climate and is an attack on transgender students." However, the statement noted that Bill 17, "was crafted specifically by the governor and legislators from a religious right group, and though this bill violates the rights of transgender students, it also harms the conservative Christians who believe that being transgender is a choice, and not who you are, or

ObjectARX was later developed into MAPI (Microsoft Active Accessibility) which introduced large access features to Microsoft Windows. It was released as part of the .NET framework. Its successor is ODBCObject. Excel is based on Visual Basic for Applications, a proprietary variation of Visual Basic, developed by Microsoft. Visual Basic for Applications is a programming language which allows programmers to create functions for use in Excel. Visual Basic for Applications is available as a part of Microsoft Office. It is also a part of Microsoft SQL Server and Microsoft Access. AutoCAD has dozens of scripting languages. The most widely used are ADL (Autodesk Data Language), AutoLISP (Autodesk Layer-Specific Language), Visual LISP (Visual LISP is the older version of AutoLISP, but still widely used) and Visual Basic for Applications. Initialize plugin on page load I'm using TinyMCE in my web application. I have some settings in config.js and I want to load them before TinyMCE plugin is initialized. I was trying this: `init: function (editor_id, options) { this.settings = options.settings || {}; this.settings.setup_preview_image_handler = true; }` But when I try to load a page that contains `tinymce`, it throws me an error: `Uncaught TypeError: Cannot set property 'setup_preview_image_handler' of undefined` A: I guess you are using the version of `tinyMCE` that has been released on August 29. There is a lot of change in that version. First of all you have to initialise the `tinyMCE.init` function. `tinyMCE.init({ //... //other options setup_preview_image_handler: true });` I don't know if it is the same way to setup `a1d647c40b`

When a developer develops an application, it typically requires some amount of prior experience to know how to design, create, and develop an application that is able to execute the desired functionality. However, if a user or a casual user has some experience with a particular application or a programming language, they may be able to write some code to write a custom automation script that does not require any programming experience. Such users typically write scripts using a text-based language, such as Python, and these scripts may be executed by using the AutoIT Library. However, due to the current state of AutoIT, there may be bugs or other defects in the Scripts that have been written. These defects may be present in the scripts, or may be introduced through updates to the AutoIT libraries. Currently, a user may write a Script to automate an application that is used by hundreds of thousands of users and that may have a plethora of defects. In order to track and identify these defects, a person (e.g., a person that writes and maintains the AutoIT libraries) is required to open each Script that is used by AutoIT to determine whether there are any defects in the Script. However, the defects may be difficult to locate due to many Scripts being written and the defects may be difficult to identify due to many defects being introduced by each Script. Moreover, in order to maintain the Scripts and other information pertaining to the Scripts, a person is required to keep the Scripts in a server or some other separate computer, and to edit the Scripts manually to determine if any defects are introduced, to update the version of AutoIT that may be used, and to keep the Scripts up to date with the AutoIT libraries. In the prior art, if a person wants to know about a particular defect, they may have to access a separate file, a separate database
