shapes in a simplified way. MathFields is a Java desktop application. It doesn't include any installation setup, making it a straightforward tool for computing in a simple way. A native app It's possible to configure your settings in MathFields, but you don't have to. You can use it without having to be constantly monitoring its status. You don't have to worry about the accuracy of the calculations, since the program uses a real-time mode, and a recording buffer. MathFields uses multi-threading to calculate the measurements of the objects, and it's possible to keep track of the overall progress without interrupting the calculations. To add the dimensions of an object, you'll need to specify the dimensions of the frame, and enter the absolute height and width of the object. It's possible to switch between three different modes, and to combine them with different measurement units. You can choose to add, subtract or find the total area of a selected shape, while also choosing between different measurement units. It also includes different types of measurement units, in order to avoid any overlapping or mistakes. No setup required, besides Java As with most Java desktop applications, MathFields needs to be installed in your computer before starting its runtime. The application comes packed in a single.jar file that can be saved anywhere on the disk or copied to a removable storage unit, so it's a breeze to install and use. If you want to uninstall the software, you can simply delete this file, and it will be easily detected by the system. Evaluation and conclusion MathFields offers a simplified user interface that's easy to use. The program is multi-threaded, and it's easy to follow its operation. It's a native app, and it doesn't need any installation setup
