I would like to know if it is possible to upload data to my mysql database, without using a file. But if I do this, what are the proper ways? What I want to do: $new = $db_con->prepare("INSERT INTO users (name) VALUES (?)"); $new->bind_param('s',

$_POST['name']); $new->execute(); A: Yes, it is possible to do this. Just put the data in a string and bind it as a string. In the function, you'd do something like this: $new = $db_con->prepare("INSERT INTO users (name) VALUES (?)"); $new->bind_param('s', $_POST['name']); $new->execute(); $new->bind_param('s', $_POST['name']); Meaning, you'll pass the $_POST['name'] to the query as a string and bind it as a string. Note that if you want to bind a string with a value that is not a string, you can use a list of parameters. So, if you have a number, you can bind it like this: $new = $db_con->prepare("INSERT INTO users (name) VALUES (?,?,?)"); $new->bind_param('sss', $_POST['name'], $_POST['age'], $_POST['city']); $new->execute(); And, in the function, you'd bind the values like this: $new->bind_param('sss', $_POST['name'], $_POST['age'], $_POST['

Models AutoCAD models are stored in a file format known as the DXF (Drawing Exchange Format) file format. DXF files contain a set of rectangles to which line and polyline (collection of line segments) objects are attached. Together, these form a model. The classic file layout consists of: A line segment, or a "line." A line is typically composed of at least two points. A polyline or a "polyline", which is a collection of lines. Polylines can contain closed curves and compound curves. In other words, a polyline can be composed of a series of connected lines. A compound curve, which is a combination of a series of lines and polylines. The classic format of DXF files are readable by most DXF-capable drawing programs. AutoCAD reads the DXF file and renders the model using the information it contains. Models are intended for the purpose of illustrating various aspects of construction, assembly and other aspects of architecture,

engineering, manufacturing, and other similar fields. Some of these are shown below: Floor plans Roof plans Architecture and engineering drawings Construction drawings Shop drawings Mechanic drawings Drafting standards such as architectural and civil Models are also used for representing 3D objects, such as: 3D renderings Models of rooms and fixtures Mass production models The main purpose of AutoCAD models is to allow users to demonstrate their concepts in 3D. They can also be used to generate off-line technical drawings, and are very useful for archiving data. IES, CAD, and 3D AutoCAD IES is the abbreviation for Integrated Engineering Solutions, and is the standard suite of CAD and drafting software. It is the successor of Revit, which was a competitor of the current version of AutoCAD. Some CAD standards are compatible with AutoCAD. Examples are: AutoCAD supports IGES and STEP, 2D and 3D formats, and as of 2016 it supports 4D, a new format

introduced in 2016. IGES is supported by all versions of AutoCAD, including X, Y, Z, X+Y, 2D and 3D. AutoCAD also supports ANSIG, a standard for describing building and piping systems. The IES format is proprietary and based on old standards. The main features of the IES
