Use command line API to execute automation functions Open command-line help dialogs with help files AutoCAD provides a mechanism to write scripts called Custom Actions. The script runs when the user selects a tool from a menu or when they double-click on a specific object. The resulting output of the script is a block of text that is displayed by the user in the viewer. To a certain extent, the format is similar to other text editors such as Notepad. The AutoCAD Custom Actions are generally written in the Visual LISP language. When a tool is selected, it runs the custom action. Many times, a custom action is used as an embedded macro that invokes a macro recorded with another command. While it can be easily created, custom action processing is often used to implement more complex operations such as "AutoCAD" tools with an added graphical effect, "Action Windows" or interaction of different custom actions. Other APIs available include Open XML SDK,.NET, Visual Basic and Visual LISP. Net 3.5 development Net 3.5 development can be used to automate certain operations, such as repeating and drawing shapes, from the Command line. I have a unique index where two columns are in use and one is a primary key. I have read that a primary key cannot have a unique index because a primary key must have no gaps. Does the same rule apply to unique index? If so, in this scenario, is it better to only have a unique index on the column that is the primary key? A: The same rule applies to unique indexes - it must not have gaps. However, there are exceptions to that - see SQL Server unique index with gaps. You also don't have to have a primary key - you can have a unique index without a primary ca3bfb1094
