Collaboration features AutoCAD allows multiple users to work together on a drawing. Work in progress can be synchronized among members of a team, and features such as pencil, keyboard shortcut, and team document sharing can be used to organize different design activities. Tools can be given to a user so that they can apply them to a selected object, or the user can receive the tools with a linked file. AutoCAD LT does not support team collaboration directly, but it supports a standard Windows network folder shared by everyone in a network, which can be used for team-oriented collaboration. In order to work collaboratively, all users need access to AutoCAD or AutoCAD LT with the design entity under version control. AutoCAD LT is a client-server application that supports a design entity, but is not versioned by design entity. When an entity is initially opened in AutoCAD LT, it remains opened regardless of whether the users are working on it. In order for other users to be able to access a design entity, they need to share it via a network folder. If a shared folder is not available, then access may be granted through a Windows domain. AutoCAD LT does not support collaboration with other applications that do not use the Windows operating system, such as applications written in the Java programming language. Interoperability Interoperability is the ability for one application to access and modify data in another application. AutoCAD is based on Autodesk's earlier application AutoLISP, which introduced database tools called "objects." These objects represent CAD data, such as points, lines, and text, and have properties such as position, color, and size. Each object is represented by a record in a database, such as a table or a file. Records can be shared between applications. In this way, objects are similar to database records. The primary database in AutoCAD is the Drawing Data Base, which stores the settings and modeling information of the current drawing. The Drawing Data Base, also called a CAD database, contains objects, their properties, and their geometric data. Objects are stored in separate.cdb files. Each.cdb file can be viewed or modified in a form called "view" that does not affect the application of other drawings. When a user opens a drawing file, the application automatically saves the state of the drawing, including the drawings data. If the user modifies the drawing, the drawing data is synchronized ca3bfb1094
