## **What's New In NewBlue Audio Equalizers (formerly NewBlue Equalizers)?**

Equalizers simulate the way human ears adjust the volume to compensate for many different levels of sounds. How much will that sound level increase or decrease for your particular listening situation? What are the resulting sounds? How can you hear the differences when the sound level is changed? How can you improve the sound quality for particular applications? After an hour of listening to your playbacks, you can make some general improvements on your sound quality. For example, your phone signal is very low and you can no longer hear the song. Simply switch to a different equalizer and manually increase the gain. While you are listening, you notice that the bass sounds a little too heavy. Switch to the bass equalizer and adjust the bass cut to your liking. You immediately notice that you are playing too softly because the sound sounds weak. All you need to do now is switch to the treble equalizer and increase the treble gain. To get even more familiar with your equalizers, you can increase the levels for the adjacent equalizers. By increasing the volume first, then the bass equalizer, then the treble equalizer, you will notice the difference between the resulting sound. In real life, human ears are always able to selectively adjust their sound volume to maintain a balanced sound. For example, if you are playing a loud song while you are talking on the phone, your ears allow you to balance the high levels of the music with the low levels of your conversation. If you play the song too loud, you can set the equalizer to adjust the volume of the song downward and let you hear the resulting sound. This is how you adjust the equalizer. When using Equalizers, you can set the equalizer at the beginning of the audio workflow, as a last step, or you can use it in front of an audio processing plugin such as a compressor or de-esser. There are two ways you can adjust the Equalizers. You can manually adjust the levels in the settings or you can adjust the levels using the graphical interface. You can also pan the equalizer to control the sound coming from a particular channel. NEWBIE EQ NEEDS HELP?
