* **Illustrator:** Adobe Illustrator was originally a drawing and illustration program. Although it includes a bitmap image editor, as of this printing, it's a primarily a vector illustration program that allows you to type, edit, and manipulate vector or path objects. The most useful features of Illustrator are its drawing tools and its built-in photo editing tools. * **InDesign:** InDesign is designed specifically for layout and print. Once you know how to format a page in InDesign, it's possible to replicate that page in an inexpensive word processor as well as in virtually every popular publishing system that uses an editor, such as **Quark** or **PageMaker**. InDesign also has the capability to export your documents to PDF or to send your documents to print shops and to create working files in Photoshop for clients. * **Lightroom:** Designed specifically for photographers, Lightroom has also been able to generate PNG files and is available as a smartphone application. The main difference between Lightroom and Photoshop is that Lightroom focuses on cataloging and editing photos, where Photoshop is a multipurpose tool. * **PhotoShop Elements:** The first image-editing program from Adobe, PhotoShop Elements has primarily focused on editing photos and JPEG files, although it can save files in other formats, including TIFF and GIF. * **Adobe Stock:** Commercial stock photography stores have websites that offer a range of stock images for licensing. The choice of images is overwhelming, but each company offers a quick way to search for images that are appropriate for your project. In addition, any stock photo website has a searchable online database where you can get specific advice about what images will work best for you. * **Adobe Bridge:** A tool that consolidates images from multiple sources, Adobe Bridge can pull image information from a range of sources. You can quickly search for photos in a range of formats by keyword, and it lets you organize images by date. * **Photomatix:** An advanced cross-process function that, when used with the right settings, can dramatically improve the contrast of a black-and-white photo. * **Premier:** Originally Adobe's creative suite tool, Adobe Premier now includes an image editor for those capable of using Elements and Power Photoshop. Photoshop has simplified a number of tasks related to the creation and manipulation of images. As a result, we expect more and more

April 18, 2018 Update: The 2018 version is a big update for the software. Photoshop Elements 2018 comes with a lot of new options to expand and upgrade its capabilities. So for most of you, it's a big opportunity to make use

of the old version of the software. Here are some of the noticeable improvements: 1. RAW Processing There are now several options to process images in RAW mode, a mode with which most images today are shot. This mode has been changed to enhance the user experience. However, for photographers, it is a must as many cameras such as the Nikon Df and Canon 5D Mark IV can only process raw files for the editing process. If you are a person who prefers to shoot in RAW mode, and would like to edit your images with this option, here are the Raw Processing options in Adobe Photoshop Elements 2018: RAW Developer: If you are a skilled developer, you can use this feature to modify and improve the RAW image. RGB Channel Processing: To enhance the colors or contrast of your image. Luminance Channel Processing: This option enhances the contrast and contrast of your image. Shadow/Highlight Channel Processing: When you have a lot of shadows or highlights, this option will enhance 05a79cecff

List of longest flights by continent This is a list of the longest flights by continent for an aircraft that holds a "non-stop" world record for the distance, defined as any distance shorter than. The criteria for inclusion are: a distance of at least between the location of the aircraft departure and destination, actual distance flown by the aircraft between these two points, and that the distance is not exclusively measured via the shortest (a non-stop) air route. The list is organised by continent. The continent itself is defined by the World Meteorological Organization as the land area of one or more of the various nations that exists as a single administrative unit and shares a common language, in this case English. Notes A: The distance between the two locations can also be determined as twice the radius of a circle. For example, the distance between New York and London is approximately $(\pi/2)$ *(the distance between the two cities), or. B: The total distance covered by the aircraft is also not always the shortest distance between the departure and destination, but is often the shortest distance via a non-stop route, such as a straight line or a route following a national border, depending on the terrain (e.g. mountains and oceans). For example, an aircraft flying from New York to London non-stop has gone more than twice the distance between the cities (2x radius of a circle), while the aircraft will have covered the same distance using non-stop routes over land (including non-smooth terrain) several times the distance between the cities. However, the record held in 1996 of a flight using non-stop routes across the English Channel and the Atlantic Ocean is still held by Boeing on a flight from London to Frankfurt, the total flight distance flown by the aircraft was of which over land at least. C: The data is as of the date of the record, not necessarily when the aircraft was built or when it broke the record. D: Note that the distance between Sydney and Auckland is not the same as the distance between Los Angeles and New York, because they are on two different landmasses. Using a multi-variable mathematical model, researchers from the University of Georgia investigated the contributions of various climate factors to the mass extinctions documented in the fossil record. The study found that the average number of mass extinctions in the past 125 million years was roughly once every million years, with a range of one to a few hundred per million years. The research team then looked at extinction events in five mass extinction eras to see what the dominant climate factors were in each of those eras, which determined the amount of warming that occurred in each era. "We found that when there are temperature spikes, there are more mass extinctions and even some extinctions that are even larger than the most devastating mass extinction recorded in the fossil record," said Doug Archibald, UGA professor of Earth system science and College of Environment and Natural Resources. "This is the first study that has used this level of detail to look at multiple factors that influence extinction and what we're finding is that the extinctions that are occurring today are a lot more than what was recorded in the past," he said. "And the amount of warming that occurred in the past has a lot to do with how far we are going to get in the future. So there's a real danger if we continue on the same path of greenhouse gas emissions, that we get more of those types of events and that we could disrupt ecosystems on a much larger scale in the future." The team's model used data from 410 mass extinction events in the past 125 million years to look at the same geologic and climatic variables used in the current study. They found that the most important factor in determining the number of extinctions was the amount of warming that occurred and the intensity of that warming. When warming was relatively moderate, extinctions were much less common, as seen in the past 130 million years. In contrast, extinctions spiked dramatically in mass extinction eras when the average temperature increased by more than 5 degrees Celsius, which is about a 7-degree Fahrenheit increase. When warming was particularly intense, extinctions were even more common. This was the case during the Paleocene-Eocene Thermal Maximum (PETM), which occurred 54 million years ago. "It's pretty amazing to actually see that in a million years' time, we're going to have many more extinctions than we had in previous periods," said Archibald. "It tells us that we're at risk of being in a situation that is completely out of the ordinary from what we
