"Aero Glass enabled : it's a.Q: Try to solve $\min_w \|w - \theta\|_2^2$ \text{ subject to } w_i \ge 0 \text{ for all } i\$ I would like to solve the following problem in python. I have $\theta \in \mathbb{R}^p$ and $y \in \mathbb{R}^m$ where y is the observed feature vectors. I want to minimize $\|w - \theta\|_2^2$ subject to $w_i \ge 0$ for all i . That is, we want w to lie in the convex hull of the observed feature vectors. I would like to solve this in Python. A: Is there anything special about w lying on the convex hull of y ? For that matter, for the m constraints ($w_i \ge 0$) you can also use a mixed-integer (MI) problem solver (e.g. Cplex, Gurobi) If you do want to find the minimum $\|w - \theta\|_2^2$ with $w_i \ge 0$ for all i , then you are, in a very general sense, asking for a solution w to the following continuous problem: $\min_w \|w - \theta\|_2^2 \text{ subject to } w_i \ge 0 \text{ for } i=1, \dots, m$ If I understand the problem correctly you also want to find the constraint $w_i=0$ where w_i is non-positive. If you represent w as a vector in \mathbb{R}^{m+1} (one additional row for the unconstrained w_0) $w = (w_0, w_1, \dots, w_m)$ then you have a quadratic programming (QP) problem $\min_w \|w - e\|_2^2$ e79caf774b
