Photoshop is not intended as a beginner's or casual computer tool. If you're new to computers and don't have basic skills in using programs, then you're better off learning some basic skills on your computer before using Photoshop. Other highly popular image programs include Adobe Illustrator, which is a drawing program, and Adobe Fireworks, which is a page layout program. Fireworks is used for website layouts and brochure design and is similar in many ways to Photoshop but is not as popular. To learn more about these programs, visit your local computer store or check out 'www.dummies.com/go/photoshopaioideshow'. Photoshop Elements Adobe Photoshop Elements is a program designed specifically for home users. It shares the same basic design as Photoshop, but it's built with a more beginner-friendly interface and offers some limited learning curves for Photoshop beginners. With a limited feature set, though, you can't perform any professional-quality image editing work. Adobe Photoshop Elements has a two-step learning process: • The Elements helps introduce the programs' basic concepts and design features to you • The Photoshop learning steps teach you the advanced image editing features found in the "professional" version of Photoshop (refer to the preceding section) The downside to Elements is that it doesn't have the volume of tutorials available to Photoshop beginners, and it's not quite as advanced as Photoshop. You can find Adobe Photoshop Elements at the link at the bottom of the adobe website (`www.adobe.com/products/photoshop_elements.html`). The Learning Curve for Photoshop Elements Adobe Photoshop Elements is specifically built for users of computers who don't have previous computer experience. If you don't have any experience with computers, Adobe says you should have about the following skills: • Clicking and dragging with the mouse. • Using the keyboard arrows or keys to navigate through pictures and documents. • Using web browsers, such as Google Chrome or Safari, to open applications and navigate the Internet. • Understanding basic commands for the Open dialog box, such as Choose File and Open. Before you start using Photoshop Elements, you need to read the instructions carefully in order to take full advantage of the program. If you're a long-time Photoshop user, you may find that some features are not as intuitive as they once were, but the program is still a useful tool for creating

$}$. This restricts the gap between π_t and the plane of opposite faces to be at least $D_t/6$. We translate the positive sides of the triangle ABC into the corresponding polygons on the surface of $\tilde{\mathbf{S}}$. Then, if the space between the polygon $\tilde{\mathbf{A}}\tilde{\mathbf{B}}\tilde{\mathbf{C}}$ and the plane π_t of the fiber face containing the edge $\tilde{\mathbf{A}}\tilde{\mathbf{B}}$ is greater than or equal to $\frac{D_t}{6}$, the gap must be greater than or equal to $D_t/6$, which contradicts to what we have assumed. Thus, the space between the polygon $\tilde{\mathbf{A}}\tilde{\mathbf{B}}\tilde{\mathbf{C}}$ and the plane π_t of the fiber face containing the edge $\tilde{\mathbf{A}}\tilde{\mathbf{B}}$ is less than or equal to $\frac{D_t}{6}$. In a similar way, we can show that the space between the polygon $\tilde{\mathbf{A}}\tilde{\mathbf{B}}\tilde{\mathbf{C}}$ and the plane π_s of the fiber face containing the edge $\tilde{\mathbf{B}}\tilde{\mathbf{C}}$ is less than or equal to $\frac{D_s}{6}$ for the time t along the path α. It can be shown that D_s-D_t

Q: How to get the Display Name of '@' sign(Address) using Java I am new to Java. My question is how to get the Display name of "address" ("(address)" in this case. I have a string: Person A + B + C (address) -> JPA Model How to get the display name of "address". Please help me Thanks A: You can have the look at the following methods /** * Calculates the first character of the {@code string} and returns it. * * @param string * the {@code String} to get the first character from. * @return the first character of {@code string} * @throws StringIndexOutOfBoundsException * if {@code string} is {@code null}. */ public static char firstChar(final String string) and /** * Calculates the last character of the {@code string} and returns it. * * @param string * the {@code String} to get the last character from. * @return the last character of {@code string} * @throws StringIndexOutOfBoundsException * if {@code string} is {@code null}. */ public static char lastChar(final String string) Hence, you can use StringBuilder stringBuilder = new StringBuilder(); stringBuilder.append(firstChar(s)); String str = stringBuilder.toString(); System.out.println(str); String str2 = lastChar(s); System.out.println(str2); This will give you the output as ( ) Question 1.
