Warning Be careful when using layers. Layers are an essential part of working in Photoshop. If you mess up the layers, it's very difficult to undo your editing. For more information on layers, see Layers (Hidden Features). ## What is a raster image? A _raster_ (semiconductor image sensor) is a screen that enables you to make a digital image. In the case of a digital camera, the sensor is a matrix of tiny photosites that collect light to create an image of the surrounding world. When you take a picture, all the elements of a digital image are converted to a series of individual pixels. This two-dimensional surface is technically a _raster._ When you take a picture using a regular camera, the image that results from the pixel collection is an analog image. Pixels are not individually addressable. Instead, the pixels are addressed as an entire matrix with a certain number of _color depth_ (grayscale levels). With a color camera, the pixel is a color that is assigned to each image element. You can easily see the individual color components of each pixel on a color-transferred image. (See Working with Layers.) ## Understanding the Layers Panel The Layers panel is the bread and butter of Photoshop. As mentioned, it works like a layer collection of individual layers. Each layer is composed of the image elements that will be seen in the final version of your image. Every item that makes up the image can be either a layer or a selection, and each layer has a separate layer mode. (See Understanding Layer Modes.) If you want to draw an image in Photoshop, for example, you select a new layer and then start creating the elements you want to include (such as drawing a line or icon). These are independent layers that move around the image as you work. If you want the whole image to appear one color, you use the Paint Bucket tool to fill the layer with that color. If you want to make a part of
