SoftwareÂ .Rechargeable batteries are used in many different portable electronic devices. Examples of these electronic devices include mobile telephones, cameras, calculators, personal digital assistants (PDAs), portable computers, notebook personal computers, personal organizers, pagers and other wireless and/or cellular telephones. The specific electrical requirements of a particular battery are determined for the particular application by considering the need for long, medium and short battery life, to provide a particular size battery and other battery performance characteristics. One aspect of battery

performance is the current that can be drawn from the battery by the application device. The battery pack has an actual current capacity which is not representative of the ability of the application device to draw current from the battery. The actual current capacity of the battery is the maximum amount of current that can be drawn from the battery without the battery temperature rising, and the battery being otherwise damaged. When an application device is connected to a battery pack, the battery may provide only a small fraction of the current drawn by the application device. In order for the battery pack to provide the maximum level of current to the application device, the battery in the battery pack must be operated at a level that satisfies the battery's charge limit or maximum charge state. However, it is not desirable to operate the battery in the full charge state because the battery will be quickly discharged if the application device draws current from the battery. Consequently, it is desirable for a battery pack to reduce the current drawn by the battery to a level that is no more than the actual current capacity of

the battery. The ability of a battery pack to provide this level of current to an application device is the battery's ability to deliver rated current of the application device under load (rated discharge current). A number of problems are present when attempting to reduce the current drawn by the battery to a level that is no more than the battery's rated current. For example, some algorithms use a power flow constraint to solve for charge and discharge limits of the battery pack (see for example, U.S. Pat. No. 6 6d1f23a050
