Various types of engines, such as Diesel engines, employ control valves in addition to the main valves employed to control the air/fuel mixture entering the combustion chamber of each cylinder. Such control valves are used to provide dilution of the mixture by permitting more air into the combustion chamber than is able to pass through the main intake and exhaust valves during engine speed. More specifically, intake control valves open to admit additional air into the cylinder during the compression process and/or during the exhaust process to thereby maintain an even and uniform mixture throughout the combustion chamber. The problem to which the present invention is directed is the detection of gas leaks from these control valves when engine speed is idle, i.e. when there is no pressure developed in the combustion chamber of the cylinder. When the gas leakage is large enough, the engine can be ruined by burning excess fuel which may be present in the engine cylinder. Therefore, it is essential to accurately detect the small amount of gas leakage which is acceptable in a spark ignition engine. Accordingly, it is an object of the present invention to provide a method of detecting gas leakage from control valves of a series of engine cylinders and for shutting the engine down in the event of a large gas leak. Another object of the present invention is the method of detecting c6a93da74d
