Field of the Invention This invention relates to a braid and particularly to a braid for achieving effective thermal and electrical insulation of an embedded wound conductor. 2. Description of the Prior Art Embedded wound conductor, such as a cable including a conductor embedded in an insulator, is known to be designed so that the conductor is electromagnetically shielded. This electromagnetically shielded conductor is referred to as a "shielded conductor". The shielded conductor is often referred to as a "built-in-shield". The typical shielded conductor includes an insulator with a conductor embedded in the insulator along its axial direction. In an assembled state, the electric conductor is inserted into the insulator so as to be embedded with the insulator, in a manner that the electric conductor faces toward the exterior. The above-stated shielded conductor is designed to

make the shielded conductor meet electrical connection with another shielded conductor or metallic conductor (referred to as an "in-line conductor" in this specification). This in-line conductor is usually embedded in the shielded conductor in a position adjacent to the electric conductor.

Therefore, when the shielded conductor is to be connected to the in-line conductor, the electric conductor embedded in the shielded conductor is often connected to the in-line conductor through a conductive member. In designing the shielded conductor, there has been a need for an effective thermal and electrical insulation of the electric conductor, the shielded conductor, the insulator, and the like from the metallic conductor. To this end, it is necessary to provide, for example, adequate insulation between the electric conductor and the conductive member and insulation between the shield conductor and the conductive member. Such insulation is designed to meet insulation and compression standards and requirements. While the above-stated insulation generally meets the insulation and compression standards and requirements, it has been difficult to design such an insulation which meets all the standards and requirements. More than a dozen of Microsoft's best-known

employees are calling on the company
